Nephrotic Syndrome with Lesion of Focal Glomerulosclerosis

National Cancer Institute

Source

National Cancer Institute. *Nephrotic Syndrome with Lesion of Focal Glomerulosclerosis*.
NCI Thesaurus. Code C35533.

A renal functional disorder characterized by proteinuria, edema, hyperlipidemia and hypoalbuminemia. It results from damage to the renal vascular filtration apparatus. It is further characterized by scarring of some of the glomerular capillaries. Sequelae may include hypertension, atherosclerosis, infection, hypercoagulability and renal failure.
