Thank you for the article, which captivated me with its title, as I consider it to be an important area of bioethics since decision-making in healthcare is a central issue.

However, I feel that the article is too focused on the field of philosophy, despite the author making references to psychology within it. Nonetheless, the author does not use works from psychology to justify the assertions made about intuitions. And when I mention psychology, it could also be neurology. To cite just a few of the more well-known figures (António Damásio and Jonathan Haidt) who could provide important contributions to this reflection and give it a more rigorous and less opinion-based framework.

However, respecting the author's choice, I do not have much more to add to the text since I have limitations in discussing it philosophically.

Thank you very much
