Hany Akeel Al-Hussaniy et al. submitte paper entitled Nanocarriers for protein and peptide drug delivery. It is important topic due to enormous potential of peptides in modern therapies. Nanotechnology is very useful in overcoming the limitations of peptides. Authors propose review paper that explores the development of structure-based nanocarriers designed for drug delivery. In my opinion manuscript can be interesting for the readers. Nevertheless, my comment concerns the method of selecting articles for writing a review - these should rather be specialized sources such as medical databases (and the scope of keywords should be expanded). Currently, there are many questionable/controversial and poor quality works in the literature - information from such articles should not be repeated/quoted and mislead readers/experts. Authors should check literature once again and critically correct paper.
