Potential competing interests: No potential competing interests to declare.

The manuscript presents a screening of the antibacterial capacity of 4 aqueous and ethanolic plant extracts. This is the first step in the study of the antibacterial properties of any material. The results are promising, particularly those of the ethanolic extracts. It would be very interesting to have their chemical characterization. Some details would be needed, for example, how the bacterial inoculum was prepared: the culture medium, the initial OD. Also, to improve the manuscript, the quality of photographs of the agar plates could be enhanced in order to better appreciate the inhibition zones.
