**Potential competing interests:** No potential competing interests to declare.

The author should elaborate more about the research done on expansion of the Universe. Also, he should talk more about alternative theories which denies the expansion of the Universe. Hubble constant and the work done in that respect such as Hubble tension should be elaborated. When the bijective function is stated, is this similar to the so-called particle dominated universe and its counterpart anti-particle Universe?

I would recommend these can be clearer in a different version of this article.
