Potential competing interests: No potential competing interests to declare.

The paper is well-structured and provides a comprehensive overview of the research methodology, including the use of the CAM model for land use change prediction, the estimation of the transition probability matrix, and the validation of the predicted land use maps. However, there are some suggestions to improve the article, which I have mentioned below:

- The title is too working. You can consider rephrasing it, like;
 "Assessing the Impact of Future Land Uses on Flood Risks and Ecosystem Services Using a Cellular Automata Markov Model and Hydraulic-Spatial Valuation Integration"
- 2. Authors should re-arrange the keywords alphabetically.
- 3. In the study area section, the figure related to the location of the area should be shown.
- 4. In Figure 2, it is better to use exported images instead of screenshots.

Good luck!
