Potential competing interests: No potential competing interests to declare.

The report effectively summarizes various approaches for addressing dengue in Mexico, including herbal remedies, vector control, and pharmacological studies. However, it could benefit from slightly more concise language to enhance readability. The discussion of vector control methods, such as the sterile mosquito technique and the use of Wolbachia, is valuable. This report is a valuable overview of the efforts to combat dengue in Mexico, but it could benefit from more precise language, transparent referencing, and a stronger concluding section.
