CREM wt Allele

National Cancer Institute

Source

National Cancer Institute. <u>CREM wt Allele</u>. NCI Thesaurus. Code C162404.

Human CREM wild-type allele is located in the vicinity of 10p11.21 and is approximately 86 kb in length. This allele, which encodes cAMP-responsive element modulator protein, is involved in the modulation of gene transcription. A fusion involving this gene and the FUS gene may be associated with epithelial tumors.
