HPV 16 E6 (18-26) Peptide

National Cancer Institute

Source

National Cancer Institute. *HPV 16 E6 (18-26) Peptide*. NCI Thesaurus. Code C38117.

A peptide derived from the oncogenic human papillomavirus (HPV) early gene product E6. The HPV 16 transforming protein E6 is expressed in precancerous and malignant cervical lesions and has a high affinity for the most common human lymphocyte antigen (HLA), HLA-A2. Immunogenic peptides from the HPV 16 E6 may be used to trigger a T-cell-mediated immune response to HPV. (NCI04)
