Potential competing interests: No potential competing interests to declare.

1. The exploration of *Fragaria ananassa*'s ethanolic extract as a potential neurotherapeutic agent provides an exciting avenue for addressing methamphetamine toxicity.
2. The thorough methodology, including the careful preparation and administration of substances, adds credibility and clarity to the research process.
3. The incorporation of various analytical methods, including histological examinations and oxidative stress markers, enriches the study's findings.
4. Employing SPSS for data analysis with a clear significance level enhances the reliability and validity of the results.
5. The study's findings suggest that *Fragaria ananassa* extract could offer a promising approach to mitigating the adverse effects of methamphetamine, which is highly valuable for future therapeutic strategies.
6. The structured presentation and thoughtful discussion of results in relation to existing literature contribute significantly to the paper's scientific merit.
7. Expanding on the biochemical or molecular mechanisms through which *Fragaria ananassa* exerts its effects could provide deeper insights into its therapeutic potential.
8. Adding information on how the sample size was chosen could further support the study's statistical power and conclusions.
9. Including groups treated with *Fragaria ananassa* extract alone might offer a clearer picture of its independent effects, enhancing the study's breadth.
10. A discussion on the dose-response relationship of *Fragaria ananassa* extract could provide valuable information for its safe and effective use.
