Reviewer Comments to the authors

The authors describe an interesting work in manuscript and investigation of the effects of supplementation with Moringa oleifera on the antioxidant and oxidative stress markers of infertile women. Throughout the Introduction part of the manuscript is well structured and well written and provides suitable background to the relevant research. Accordingly, the manuscript requires minor revision. Following are the minor concern to be addressed:

1. The author prepared the report on 30 to 35 age group women only, what is the effect of the less than 30 age group and more than 35 age group women should be incorporate in the manuscript to increase the importance of Moringa oleifera.
2. What kinds of nutrients present in the Moringa oleifera provide in the table, name of the nutrients value and their percentage value?
3. To properly convey the study findings and their importance, the manuscript would benefit from increased language skill and writing clarity specially in the discussion part.
4. Few latest references should be included if available on Moringa oleifera on the basis of nutrient value.
