**Potential competing interests:** No potential competing interests to declare.

The subject of the work mentioned in the title is very interesting and not yet explored by different researchers in the area. However some topics included in the paper (section 2 to 4) to give support to the ideas of the author (Section 5) are presented without enough depth.

The author self references many times along the text. In some cases there are other references that could also be mentioned.

The ideas closely related to the title of the paper are only explored in the very end of the article (Section 5 occupies less than one page) leaving us with the feeling that something is missing.

As mentioned by other reviewers I also found some typos along the text that could be easily corrected by the author.
