Potential competing interests: No potential competing interests to declare.

Even though the study has an interesting topic, it doesn't satisfy the expectations of being a scientific article literally, for it doesn't contain a comprehensive literature review, doesn't have a current research problem and doesn't have an adequate methodology definition. And, the research problem is very vague. Does this residential place symbolize the common residential places in New Delhi and it is tried to find solutions for these places? Methodology should contain an extensive statement including the definition of the room features such as window widths and heights, glazing transmittance, direction, exterior obstructions etc... Also, what type luxmeter is used and what is the height of the reference plane that the measurement is held?...
