Potential competing interests: No potential competing interests to declare.

A new and important thinking by author.

The paper is in line of events but for publication or online availability need some upgradation. Author should work on key words like they used phytoremediation in paper not in abstract so key word should be checked. the mechanism explained by author need more explanation and need to mention name of microbiota involved for better understanding. similarly for Interaction with Indigenous Microbiota. Application part should be increased for increasing significance of Paper. Mentioned name of phytohormone but not the microbes involved, similarly in other you should incorporate name of microorganisms. conclusion should be refined. after incorporation of suggestion manuscript will definitely help scientific community.
