This review is for the paper by Badri et al on flame photometry determination.....

While the paper overall is well written, I have a few minor points for the authors. As suggested by the authors, volcanic eruptions cannot be counted as anthropogenic as such. It is a natural phenomenon that needs to be mentioned in the introduction.

If the authors can provide a valid reason for considering a factor of 3.3 for LOD and a factor of 10 for LOQ, that will be more informative to a general reader.

The use of articles can be more precise.

Overall, barring these few minor corrections, I find the work publishable.
