Comments to the author:

The topic of the draft is interesting. Nevertheless, the author should reconstruct the manuscript. Firstly, the paper is too short, and only contains title, abstract, introduction and the references. Hence, the author should determine the type of the manuscript before submission. I suggest the author write a mini review or an article of medical hypothesis instead. Secondly, the chemical (Urolithin A) may be a candidate compound which is helpful for alleviating the symptoms of patients suffering COVID19, due to its anti-inflammatory and antioxidant effects. The idea can be confirmed by further experimental studies or clinical trials. Lastly, the author can also perform a bioinformatics analysis/network pharmacy analysis or molecular docking analysis to evaluate the interaction of selected compound and the viral antigens, as well as the uniform target genes of COVID-19 and Urolithin A.
