Potential competing interests: No potential competing interests to declare.

The paper investigates the level of noise pollution in educational institutions in Nigeria. Therefore, the topic of the study could be extremely interesting.

However, there are some strong limitations to the work.

1. Important information is missing in the description of the technology and the methods used to record noise levels.
2. The literature evaluation does not adequately investigate existing research on noise pollution in educational institutions worldwide.
3. The report lacks a comprehensive background that would allow readers to have a better grasp of the historical context and evolution of noise pollution in Calabar's educational institutions.
