Thank you, Qeios, for inviting me to review this study. From the outset, I found that the title "statistical overview" is uncalled for due to a few reasons: (1) it may convey a different meaning to readers as though the manuscript was about a statistical method or topic, (2) it is not in line with the aim of the study, which was to provide a comprehensive and updated prevalence and associated socioeconomic and demographic factors of anemia in Nigeria. So, adjustment to the title is advised for the authors.

A more coherent and encompassing abstract is also advisable.

A more concise and contextual introduction is necessary to provide the background of why the authors needed to embark on the study.

Unnecessary technical explanations of statistical formulas used are barely needed in the method section of this manuscript.

Tables in the Data Analysis and Discussion section may be combined and made concise to convey the main data that authors would like to highlight in the discussion. A more coherent and concise discussion is advisable.
