After examining the article titled "Enhancing Soil Stabilization in Soft Soils Through the Addition of Sand to Soil-Cement Piles: A Comprehensive Study," I understand that the paper would not be suitable for publication yet. However, I will leave some points for the author to evaluate:

- 1. Improve the organization of the text because the article is disorganized and somewhat confusing.
- 2. Absence of citations throughout the text, making it difficult to prove the veracity of the facts described by the author and weakening the debate on the subject.
- 3. References cited are quite outdated and insufficient.
- 4. Introduction is extensive, disorganized, and lacks objectivity.
- 5. Lack of a more precise description/definition regarding ECO-CSB or ECO-CSSB additives.
- 6. Which literature articles were the methodologies based on? Why use these methods? There is nothing referencing.
- 7. Methodology in some cases lacks objectivity.
- 8. Lack of discussion with the literature regarding the results obtained.
- 9. Some results could be represented by graphs.
- 10. Conclusion repeats information previously mentioned, becoming repetitive in some parts.
- 11. Lack of standards and information in references.
