Potential competing interests: No potential competing interests to declare.

The article offers an overview of the cancer situation in Tanzania. It could have benefited from including a comparative analysis on a global scale. This would have provided an understanding of the challenges and solutions discussed.

One area that could have been explored further is the infrastructure and resource challenges. While the article mentions limitations in these areas, it doesn't delve into how these challenges are being addressed. It would have been helpful to learn about long-term strategies for resource allocation and infrastructure development.

Additionally, the article mainly focuses on the setup and functioning, neglecting patient perspectives. By including testimonials or case studies, a humanized view of the impact of the oncology unit could have been presented.

In conclusion, the article on the implementation of MNH's Adult Oncology Unit is informative and extensive, highlighting the need for cancer care in Tanzania. The research conducted and emphasis on collaboration are aspects. However, to gain a rounded understanding of the unit's impact, it would have been beneficial to incorporate a perspective as well as provide detailed strategies for overcoming infrastructural challenges and incorporating patient experiences. Despite these limitations, this article contributes significantly to discussions surrounding healthcare improvements in middle-income countries.
