Potential competing interests: No potential competing interests to declare.

I appreciate the fact that authors looked at data from before vaccination and after vaccination which is also similar to what was done in this article: https://www.aimspress.com/article/doi/10.3934/math.2022298. Authors should cite this article. Authors should expand their introduction by also stating the gap in literatures this article is addressing and also improve the methodology. The methodology is not clear. This should be improved.
