The authors did a good job investigating the ethnobotanical properties and uses of Yerba Mate in Syria using questionnaires to get feedback directly from the users.

My main interest in this research borders on the Discussion section. What is the implication/significance of the results of this study? A lot of work needs to be done on the discussion section to reflect the implication of the current research, compared with previous results from other scientists' research on Yerba Mate.

There isn't a single cited material in the discussion section. I found that there are a couple of research articles previously written on Yerba Mate which could be cited in this section (e.g., Sulaiman et al., 2021; Kujawska, 2018).
