Dear authors,

The case report is a good approach to the novel treatment proposed, and the title, abstract, and introduction give a clear background of the topic. The article in general is well written and very easy to read and understand; however, there are some suggestions:

1. The authors should include more information about the patient's illnesses in the part titled "Personal information of the patient."
2. Based on the results, it is difficult to determine whether the observed effects are due to the glucosamine treatment or some other factor.
3. The safety and efficacy of glucosamine treatment is difficult to elucidate due to the short follow-up.
4. The results may not be generalized to all patient populations.
