Potential competing interests: No potential competing interests to declare.

General comment: The article is written in a well-structured manner, and all sections of the research are well done. However, these are my comments that may help to improve the article.

Introduction section: It is better to highlight literature that was conducted previously, which you already indicated in the discussion section. Example: the previous study done in another area that you described in the discussion section.

Data processing and analysis section: You indicated that the candidate for multivariate analysis is a p value <0.025 , which is smaller than the p value of significance, p 0.05. It needs clarity on how it came to be like this.

Results section: The variable name positive family history needs an operational definition. For readers, it is not clear.

Results section, Table 3: The odds ratio confidence interval is not clearly presented in the table.

Results section, Table 4: You indicate only the p value. The odds ratio with confidence interval is not described accordingly.

Recommendation section: It is better to clearly state the interventions based on your findings with regard to the risk factors. Example: Based on your findings, what are your planned interventions to avert the health problems.
