Potential competing interests: No potential competing interests to declare.

The present study concerns the study of extracts of Acacia arabica, Prosopis juliflora, Abutilon indicum and Bryonia laciniosa, and shows antimicrobial activities. The results could enable the design of plant-based medicines. The study is complete and deserves publication with some minor corrections; thus the introduction should be improved so as to better highlight the study in relation to articles already published in the field. It would be good if the authors tried to identify the compounds responsible for the observed effects.
