good greeting . I read the entire manuscript and was impressed with the idea of research and the researchers' findings. The manuscript is well written in terms of matching the title with the content of the manuscript, but I have some notes that I hope the researchers will benefit from: With regard to the discussion, it was not written in the manner described for the chemicals present in the alcoholic extract of the plant, which led to the occurrence of effects that led the conclusion to warn the researchers against dealing with them, in addition to that all criteria, whether hematological, chemical or histological, did not discuss the result by explaining the reason for what happened at the level of each of them and something else I would like to point out to him that the proportion of ancient references is many, , and it was supposed to search for newer sources to cite them. Finally, I have an inquiry about the reason for choosing two different living beings as an experimental animal. What is the purpose?

Thank you

Dr. Abeer Ataallah Al- Hadidy
