Review of: "Yield Forecasting Model for Maize Using Satellite Multispectral Imagery Driven Vegetation Indices"

Antonio Comparetti[1]

1 University of Palermo

The authors deal with a paramount topic, i.e., the prediction of crop yield, based on remote sensing of vegetation indices from satellites.

The overall quality of the manuscript, including also detailed tables, is sufficiently high for publication.

Yet, the authors should apply the changes I suggested (highlighted in yellow in the attached file) and correct the measurement units (highlighted in green in the attached file).

Moreover, they should increase the number of references by adding not only those I suggested (highlighted in yellow in the attached file) but also other recent ones.
