Potential competing interests: No potential competing interests to declare.

When it is necessary to approach the lumbar 4-5 intervertebral space from the lateral side, it is important to classify the existing anatomy according to MRI images so that the anatomy can be easily understood in terms of what we will pay attention to during the surgical procedure. However, the article focused more on anatomy. However, he did not emphasize how we can use it. As a surgeon, I would expect a recommendation in the summary section, such as do this or not do this when the vascular structures are in this position, in the conclusion sentence. I also liked the hypothesis and illustrations, congratulations.
