Potential competing interests: No potential competing interests to declare.

The manuscript discusses the protective role of Solanum nigrum against various diseases, a topic already extensively covered in existing literature. A more effective approach would involve identifying a specific active ingredient of Solanum nigrum and exploring its protective effects against a wide spectrum of diseases. Alternatively, the author could focus on discussing the roles of different active ingredients individually in combating a single disease, such as cardiovascular disease, neurobiological disease, or cancer, depending on their field of research.

One critical issue with the manuscript is the lack of coherence and connection between its sections. It appears as though disparate sections have been stitched together without a clear overarching theme or gradual progression of ideas. Additionally, the absence of commentary from the authors on the pathways, limitations, and future prospects of the targeted biomolecules in clinical trials is notable. Furthermore, the repetitive use of the author's name to begin each paragraph contributes to a sense of monotony in the text.
