Dear Authors,

Thanks for the kind request to review this manuscript. The topic could be interesting for readers, but the presentation should be improved, as the followings.

More detailed description of the research background is recommended. Both chapters "Introduction" and the "Material and Methods" should be improved.

We have not enough information about the keeping circumstances of the animals, the exact criteria of group selection, age of the animals and the final rate of sexes in each group. It is not a usual procedure to buy "experimental" animals from the local market. What was the reason of it?

Have blood samples been taken from the animals? It is also important to provide the level of fluoride toxicity in the animals. What is the physiological background of fluoride toxicity and what are the positive effects of the yogurt?

Description of the statistical analysis should also be improved. Explanations are missing from the figures.

Generally, one can tell that improving of each chapters (the whole manuscript) is recommended, with considering the reviewers' recommendations which are written in comments.
