Potential competing interests: No potential competing interests to declare.

I congratulate the author for his efforts in this study. I think that the study is weak due to the small number of cases included in the study. I suggest adding the answers to the questions I asked below to the article.

-Was sample size analysis performed for this study? How generalizable are the findings of this study, which included 20 FMS patients and resulted in 13 FMS patients?

-Why were OA patients included in the study as the control group?
