The topic on cupping for COVID-19 is undoubtedly very interesting and attractive. The traditional cupping therapy have been showed promise in the treatment of COVID-19. However, I have some suggestions as follows:

1. The manuscript were inclined to list a hypothesis based on the effect of cupping therapy for similar diseases in many studies, rather than the direct data or evidence of cupping therapy for COVID-19. It is necessary to supplement directions for further research, which mentioned in the manuscript seems too simple.
2. COVID-19 is a contagious disease, it is necessary to discuss the procedure of cupping therapy with adequate protection of the operator.
