Potential competing interests: No potential competing interests to declare.

The article tried to find the parallelism between the two years in numerical data. Beyond this, it has not been emphasized which factors (number of doctors, number of specialist physicians, qualifications of health institutions, income level of patients, nutritional status, effectiveness of drugs, age, gender, chronic disease status of the patient, etc.) are more effective in causing deaths. It is considered that the contribution of the study conducted with a simple numerical analogy to the literature will be quite limited.
