Potential competing interests: No potential competing interests to declare.

This is interesting work on Buruli ulcers. However, there is need for more detailed background information. For example, what is the disease burden currently and what has it been like in the past few years. How does knowledge practices and attitudes affect its transmission and so on.

The method used is okay but probably with enough background of the disease including the area under study, there might be information that would inform if this would have been the best method used.

The participants are very few and it calls into question as to whether a more larger sample size would have been more appropriate.

Generally, this is a good paper and it is publishable with a little more enhancement as per the suggestions I have given.
