Review of: "Analysis of Traub's method for cubic"

Sunil Kumar

Potential competing interests: No potential competing interests to declare.

The paper is based on the analysis and extension of Traub's method for solving cubic polynomials. It is observed that commas and full stops are not marked properly with equations. For an example, equations (6) and (7) should be terminated by commas. However, paper is written properly in such a way that is every section focuses to the objectives of study. One additional part should be added in this paper to emphasize the significances of the stability of results/convergence, for Traub's method for solving cubic polynomials. The tile of the paper may be more appropriate "Analysis of Traub's method for cubic polynomials" instead of "Analysis of Traub's method for cubic." If author feel that given topic is more appropriate, please explain.
