The article "[COVID-19: A Short Review on the Psychological Effects of Coronavirus, How It Disturbs Social Life, Its Mechanism to Affect the Central Nervous System, Possible Modes of Transmission, and the Smart Lockdown Policy of Pakistan](#)" seeks to highlight the mental health concerns of the people of Pakistan during the COVID-19 pandemic lockdown. Some observations: 1. The authors may wish to look for a more appropriate title for the article

2. The abstract is not well formatted

3. Authors may wish to concentrate on and expand Section 2

4. Reduce Sections 3 and 5 since the "purpose of this article is to provide a review of the effects of the coronavirus SARS-CoV-2 on the psychological health of the general public"

5. The authors did well to establish a correlation between the neurological symptoms of COVID-19 and the psychological effects of the lockdown. They should throw more light into this area

6. What about vaccine hesitancy and other issues of psychological concern?
