Potential competing interests: No potential competing interests to declare.

1. The literature review is not clear. The article starts with some background information, but lacks a clear and strictly defined literature review section.
2. The article presents a framework model but does not provide the corresponding evaluation and validation section. It lacks practical operations, experiments, and data support. Some of the intermediate formulas also seem abrupt, which may result in an overall lack of persuasiveness.
3. The structure of the article is not very clear and somewhat chaotic. For instance, the numbering of its headings appears disorganized.
4. Further language refinement is needed.
