Potential competing interests: No potential competing interests to declare.

In this manuscript, the authors presented the CNN-based road damage detection and maintenance.

1. From Fig. 6, it was observed that the training dataset was made for only bituminous roads. Using the algorithm presented in the manuscript, is it possible to detect the damages in any type of road?
2. Why was the YOLOv5 algorithm used in the study?
3. The methodology can be clearly explained.
4. Research gaps need to be included in the introduction part.
