1. At the beginning of the introduction, start with the study group, the dependent variables, and finally, the independent variables are explained. There should be content coherence between paragraphs, and they should be linked like links. The research background should be such that the research gap and unanswered questions are identified for the reader. At least in the last paragraph, state this study's unresolved issues, research gaps, and direct and indirect applications. It is important to note how the results of this study can help resolve ambiguities.
2. To express the purpose, problem statement, the definition of specialized terms or scientific abbreviations, information provided in other similar research, the necessity of research and research innovation compared to previous research, unanswered questions that this research answers, and explain how the results of this study can help resolve ambiguities.
3. In the article's introduction, two questions should be answered briefly: Does the paper address an important issue? Do you know if this research question has been raised before?
4. Sampling needs further explanation and clarification.
5. Materials and methods need to be clarified.
6. What are the inclusion and exclusion criteria?
7. In the Discussion, a summary of the findings is mentioned, and their interpretation is described. The alignment and non-alignment of the findings with the findings of previous similar research are compared, examined, and explained.

The result then practical overview and generalizability of the results and, in general, what has been added from this research to the existing theoretical and applied knowledge, has been written and, in line with it, has expressed the limitations of the study and provided analysis and used suggestions for future studies.

8. In the Limitations section, point out the factors that have restricted your research's internal and external credibility and state the methodological limitations. Make research suggestions based on these limitations and write practical recommendations based on the findings. Avoid making general suggestions, such as holding and explaining the findings based on the hypothesis's results.
9. We consider recommendations for future research an essential aspect of the process by which reviews develop thinking. So, this article should be diligent in generating new questions that need to be addressed through future empirical research and serve to drive the field forward by posing the questions and hypotheses that need to be the targets of new studies.
