

Review of: "Enhancing Soil Stabilization in Soft Soils Through The Addition of Sand to Soil-Cement Piles: a Comprehensive Study"

Mohammad Reza Emami Azadi

Potential competing interests: No potential competing interests to declare.

The topic of the submitted article is quite interesting and has a practical use. The abstract, introduction, test procedures, and samples used have been rather clearly described. The graphical illustration of the test data has been quite limited in the paper. A complete and updated literature review of the topic is not given in the article. An updated reference section might be added. A more detailed discussion of the test results and a comparison of the various types of test specimens (soil-cement-sand mixtures) should be given in this paper. Also, the technical writing of the submitted paper must be improved. Finally, the paper, after the required revision, may be considered as a technical note.
