Review of: "SARS-CoV-2 Infection and Blood Group Associations in the United Arab Emirates"

Adeolu Oluremi¹

1. Ladoke Akintola University of Technology, Nigeria

The article is well articulated. However, I have a few suggestions:

1. It would be beneficial to associate the age group of the study participants with SARS-CoV-2 infection.
2. There appears to be a mistake in the statistical analysis; a p-value of ≤ 0.05 should be considered significant.
3. The effect of blood group and rhesus factor should be considered together (e.g., O+ve, AB+ve, etc.).

Thank you.
