Review of: "Reforesting_now"

Veridiana Dalla Vecchia

Potential competing interests: No potential competing interests to declare.

The authors approach an interesting theme, which may bring the possibility to encourage reflections about forests and their substitution and reinsertion processes. However, the text needs to be better structured, respecting the structure of a scientific article. I suggest a reorganization with a clear presentation of introduction, state of the art, theoretical references, methods and discussion of results or conclusions. A contextualization with the justification and importance of the research is also fundamental.

It is important to make a better theoretical and methodological framework, with the presentation of a theoretical context, with the proper references, both to approach the reforestation theme and to define the Augmented Reality technology and its importance. In the contextualization, it is important to refer to the causes of deforestation more clearly. In the first paragraph of the text, the sentence "In Pará (one of the Amazon states) the fire starting practice by the common people is very common, and often they do it close to their house walls showing that the consequences of the fire spread are not known" gives the impression that the causes of deforestation are the "common people", when, in fact, the deforestation process occurs especially with the expansion of the agricultural frontier and activities such as mining and logging.

In the methodology part, I suggest explaining how the data collection and analysis was done. About the maps presented, there are tools that can help in a better visualization of the geographic area, including geographic coordinates, such as QGIS.
