Polydactyly of a biphangeal thumb

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Polydactyly of a biphangeal thumb. ORPHA:93339*

Polydactyly of a biphangeal thumb or PPD1 is the most common form of preaxial polydactyly of fingers (see this term), a limb malformation syndrome, that is characterized by the duplication of one or more skeletal components of a biphangeal thumb. Hands are preferentially affected (in bilateral), and the right hand is more commonly involved than the left.
