Potential competing interests: No potential competing interests to declare.

The article "Evolution of venom production in marine predatory snails" is an extensive work focused on transcriptomic analysis.

After reading, we observed that the text is dense and well introduced. The methodology was shown for each step of the study process.

The results are well presented, and the discussion ends with clarity and simplicity, summarizing the entire study.

Finally, we suggest that the article be published, but with emphasis on the final conclusion.
