The following suggestions are provided for further improving the quality of the manuscript.

1. Variables and concepts should be clearly defined. It would also be helpful if symbols are explained when they first appear.
2. I noticed that the content in Part 4 does not seem to align with the title. There are no simulation results related to this part. Could you clarify this discrepancy?
3. Could you please provide more explicit descriptions and explanations for the figures, particularly Fig. 9 and 11?
4. The discussion section appears to lack support from the current results. Could you explain the basis of the discussion?
5. While the device presented is novel, it would be beneficial to have a comparison test to demonstrate its merits. Could you consider including this test in your work?
