This paper presents the design of a quadcopter drone for precision agriculture applications. The paper is well-written, and the authors have developed an interesting piece of work. However, the design is at a very early stage of development, and the innovative contributions are not clearly defined. The state of the art should be reviewed before publication, as in most cases the references are more than five years old. Drone technology has changed completely in the last five years. The development shown is very general and can be applied to any type of drone. My opinion about the article is that it could be published if the authors make a thorough revision of the following points:

State of the art

Modelling the agricultural drone problem.

There is no correlation between the mathematical development of the drone and the final design.
