Potential competing interests: No potential competing interests to declare.

The study focuses on an important area. That is why I read this study with enthusiasm, but I had some questions on some points. I have tried to state this below. It should be more clearly stated why it is important to determine the knowledge and attitudes of university students towards waste segregation. At this point, a more detailed explanation about the importance of the study is needed. The sample size in the study should be explained. Since the sample was determined, what is the population of this study and by which method the sample size was determined should be explained. There is no need to write hypotheses in the text. In an article, it is more accurate to express them through research questions. The aim of the research is on the effect of environmental education. It is expected that there will be a significant difference between the two groups according to the fact that the experimental group received environmental education while the control group did not receive any education. In this case, it is not important that the result of the research is obtained in this way. At the same time, when Table 1 and Table 2 are examined, the knowledge levels of the two groups also differ. It is normal that the knowledge level of the group that did not receive training was low. Finally, what is written in the conclusion section is not derived from the findings. It is seen that more inferences are made. For this reason, the study should be reviewed again. [Translated with DeepL](#)
