Potential competing interests: No potential competing interests to declare.

A more comprehensive and systematic literature review consisting of previous works focused on this specific alloy, the reasons for studying this specific alloy, its different composites, and their wear properties under different conditions is needed. It is essential to report the results obtained from different works comparing the behavior and characteristics of this specific material and its composites under different conditions. In the next step, the gap in the literature can be explained, targeted, and worked on. This work, despite being very interesting, lacks the mentioned things in its introduction part. This is the first thing that needs to be addressed, in my opinion, and before going through the detailed review process.
