

Review of: "Does Sugar Control Arrest Complications in Type 2 Diabetes? Examining the Rigour in Statistical Methods and Causal Inference in Clinical Trials"

Abdul Wahid

Potential competing interests: No potential competing interests to declare.

Organize the study into distinct chapters to enhance clarity and comprehension.

Explain the rationale behind excluding trials conducted by pharmaceutical sectors, and explore potential consequences and alternative approaches.

Present the discussed results in tables to facilitate reader understanding. Consider including all relevant outcomes in tables or offering a strong justification for their exclusion.

Clearly articulate the clinical significance of observed effects and their impact on patient outcomes. Provide readers with a contextual framework to better understanding the practical implications of the statistical findings.

Discuss alternative reasons for reporting patterns and address potential biases in the interpretation and presentation of results.

In the discussion section, explore into the implications of the findings for future research directions, potential enhancements in trial design, and the necessity for more rigorous methodologies in this field.
