**Potential competing interests:** No potential competing interests to declare.

While the notion of building a structured approach with a religious basis might feel relatable to some, several problems may arise. Firstly, by associating technology with the divine, you validate the existence of divinity, and secondly, you attribute properties to AI that are nonexistent, making the approach counterintuitive.

Secondly, the main text used as a reference refers to ten commandments related to Ethical Medical AI, which in itself makes some sense since it is targeted to a specific domain to structure specific and required properties. The 10 commandments in the referenced paper are presented more as a choice to facilitate sorting rather than as a way to give the thesis a religious basis.
